

REMARKS

Claims 1-8 as originally filed in the PCT application have been canceled herein, and the subject matter thereof represented as new claims 9-16. The new claims conform to regular U.S. practice by eliminating multiple dependencies.

In addition, a substitute specification is included herewith to conform to regular U.S. practice. Headings have been inserted, clarification has been made for the purposes of making grammatical sense and for proper English. No new matter is introduced hereby. A marked up version showing the changes made is also attached. Applicant respectfully requests that the amendment and substitute specification be entered.

Respectfully submitted,

Stephan Blicher et al.

PUSH-TO-TALK INTERWORKING

Background

5 1. Field of the Invention

The present invention relates to interworking between separate communication networks using dialled connections, and especially to a ~~push-to-talk~~ Push-to-Talk communication method and system for enabling a subscriber to communicate with one or
10 more other subscribers of one or more communication networks without using a dialling procedure.

2. Discussion of Prior Art

15 It is ~~state of the art~~ well known to use a dialling procedure in digital communication systems to set up a communication path between two subscribers of a communication network or between two subscribers of different communication networks.

20 U.S. patent 6,304 558 discloses a network dispatch management system for providing a dispatch service to dispatch clients via a packet-switched networks, such as the internet. This also includes a packet-switched communication originating from a wireless communication system.

25 SUMMARY OF THE INVENTION

It is ~~the object~~ a purpose of the present invention to ~~propose provide~~ methods and systems for providing ~~push-to-talk~~ Push-to-Talk services between subscribers of different operators.

30

According to the invention this object is achieved by providing methods and systems as disclosed in the independent claims.

Other features which are considered to be characteristic for the invention are set forth in the appended claims.

The invention provides solutions for Push-to-Talk services interworking between different network operators, e.g. for example, interworking between Operator 1 and Operator 2. As there is no standard mechanism specified in order to realize the interworking ~~the following~~ a technical solution is proposed according to this invention is set forth below.

The Push-to-Talk feature enables a user to send a message, either streamed or transferred, to another user or a group of users after pressing a button or ~~initialising~~ initializing a start signal in another known technique. Special actions have to be taken to ~~organise~~ organize a Push-to-Talk Group across operators.

Within the text of this ~~patent or patent application~~ description, the abbreviation "PoC" shall means ~~push-to-talk~~ Push-to-Talk over a communication system. "PoC AS" shall means ~~push-to-talk~~ Push-to-Talk over a Communication system application server. "Operator" shall means a (network) operator providing Push-to-Talk services.

A first embodiment of the invention provides a method for operating a ~~push-to-talk~~ Push-to-Talk communication between a PoC-group consisting of at least of one member of a first communication network and a PoC-group consisting of at least of one member of a second communication ~~network, using~~ network. Using a PoC application server in each communication network is characterised by the steps of connecting the members of the PoC-group of the first network operator with the members of the PoC-group of the second network operator, and synchronising the PoC application servers to each other.

5 A second embodiment of the invention provides a method for ~~push-to-talk~~ Push-to-Talk communication between the members of an existing ~~push-to-talk~~ Push-to-Talk communication session and a group of an additional communication network, using a PoC application server in each communication ~~network, characterised by~~ network. This embodiment includes the steps of connecting the additional group to each of the existing groups of the session, and synchronising the PoC application server of the additional group to the previously synchronised PoC application servers.

10 The proposed Push-to-Talk ~~Interworking~~ interworking has several advantages.

The above mechanisms may be used for Push-To-Talk systems or any other system using group communication in any form. Further, the mechanisms apply to fixed/wireless and circuit/packet based communication networks.

15

Any address scheme, ~~e.g.~~ for example, IP-address, phone numbers, SIP-URLs, ULRs, email-addresses, among others, may be used to identify the users and groups. Dedicated signaling protocols are used to exchange information about the groups, ~~e.g.~~ such as size, member, status of the members, ~~and, the~~ and the mechanisms may be used with two or more operators simultaneously.

20

BRIEF DESCRIPTION OF THE DRAWING

25 The objects, advantages and features of the invention will be more clearly perceived from the following detailed description, when read in conjunction with the accompanying drawing, wherein:

~~In the following the preferred embodiments of the invention are described in more detail with reference to the drawings.~~

30 Fig.1 ~~shows the~~ is a block diagram showing the situation when ~~both two~~ two network operators offer Push-to-Talk groups to each other;

Fig. 2 ~~shows~~ is a block diagram similar to Fig. 1, showing the situation when only operator 2 offers Push-To Talk groups to customers of operator 2 and 1;

5 Fig. 3 ~~shows the~~ is a similiar block diagram showing a push-to-Talk User Signalling/Traffic Flow Push-to-Talk user signalling/traffic flow (Alternative 1);

Fig. 4 ~~shows~~ is another block diagram showing the Push-to-Talk User Signalling/Traffic Flow Push-to-Talk user signalling/traffic flow (Alternative 2); and

10 Fig. 5 ~~shows~~ is yet another similar block diagram showing the Push-to-Talk User Signalling/Traffic Flow user signalling/traffic flow (Alternative 3).

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

15 In ~~Figure~~ Fig. 1 the architecture is shown when two operators offer Push-to-Talk groups to each other. On the left hand side there is shown the domain of Operator 1(OP1). There is a number(1+n... m) of users (subscribers) with their end terminals 1 logged on to ~~operator~~ Operator 1. Operator 1 preferably operates his own access network 2 to provide access to his telecommunication services. There is preferably an authentication and routing element 3 which authenticates the users and routes the connection to the required services and/or destinations.

25 According to the invention, ~~operator~~ Operator 1 provides a PoC application server 4 (PoC AS) which hosts a Push-to-Talk group which is identified, for example, by the address "~~poc~~Poc-group@op1. net." The users1+n... m can be members of this Push-to-Talk group. There may also be a billing facility 5 to charge the utilised communication services to the users.

On the right hand side there is shown the domain of Operator 2 (OP2). There is a number(1... n) of users (subscribers) with their end terminals₁₁ logged on to ~~operator~~ Operator 2. Operator 2 may operate an access network 12 to provide access to his telecommunication services. There also can be an authentication and routing element 13 which authenticates the users and routes the connection to the required services ~~and/or~~ or destinations, or both.

According to the invention, ~~operator~~ Operator 2 also provides ~~an~~ a PoC application server 14 (PoC AS) which hosts a Push-to-Talk group which is identified, for example, by the address "~~poc~~Poc-group@op2. net." The users 1... n can be members of this Push-to-Talk group. There may also be a billing facility 15 to charge the required communication services to the users.

The PoC application server 4 of ~~operator~~ Operator 1 is connected via a ~~synchro~~synchronisation ~~connection~~ synchronization connection and (sync) interworking connection(IC) with ~~the~~ PoC application server 14 of ~~operator~~ Operator 2

The coordination of both Push-to-Talk groups, i.e. that is "~~poc~~Poc-group@op1. net" and ~~poc~~"Poc-group@op2. net," is managed by a common group management system 6.

Operator₁ and Operator₂ negotiate an agreement, that Operator₂ is allowed to offer the Push-to-Talkgroup"~~poc~~Poc-group@op2. net" and Operator₁ is allowed to offer the Push-to-Talk group ~~poc~~"Poc-group@op1. net" to the other operator, respectively. Accordingly, the users n+1~~to~~...m join the group ~~poc~~ Poc-group@op2.net from Op1 side and the users 1~~to~~... n join the group ~~poc~~ Poc-group@op1. net from Op2 side.

5 Via the ~~synchro~~synchronisation synchronization connection a ~~synchro~~synchronisation synchronization takes place between Operator 1 and Operator 2 PoC application servers 4 and 14, so the group members of ~~poe~~ Poc-group@op1. net and ~~poe~~ Poc-group@op2. net are known to both operators, i.e. ~~operator~~ Operator 2 and Operator 1. The ~~synchro~~synchronisation synchronization is carried out automatically by the PoC application servers 4 and 14. There may also be a ~~synchro~~synchronisation synchronization whenever a user requests update of all group members of ~~poe~~ Poc-group@op1.net and ~~poe~~ Poc-group@op2.net before sending a PoC message.

10 Figure Fig. 2 shows an identical architecture as ~~Figure~~Fig. 1. In the depicted situation only ~~operator~~ Operator 2 offers Push-To-Talk groups to customers of both ~~operator~~ Operator 2 and Operator 1. Operator 1 and Operator 2 negotiate an agreement that Operator 2 is allowed to offer the group ~~poe~~ Poc-group@op2. net. Accordingly, users n+1... m join the ~~operators~~ Operator 2 group ~~poe~~ Poc-group@op2.net from the Op1 side and user 1 to... n join the same group ~~poe~~ Poc-group@op2.net from the Op2 side.

20 A ~~synchro~~synchronisation synchronization takes place between Operator 1 and Operator 2 PoC application servers 4 and 14, so the group members of ~~poe~~ Poc-group@op2. net are known to both Operator 1 and Operator 2, that is, the group members of ~~poe~~ Poc-group@op1. net are only known to ~~operator~~ Operator 1 but not to ~~operator~~ Operator 2. The ~~synchro~~synchronisation synchronization takes place automatically by the PoC application servers 4 and 14 and also in case a user requests update of all group members before sending a PoC message.

25 ~~Figure~~Fig. 3 shows the ~~push-to-Talk User Signalling/Traffic Flow~~ Push-to-Talk user signalling/traffic flow according to a first alternative. Only OP2 is allowed to offer his group ~~poe~~ Poc-group@op2. net to Op1. A user User m with his terminal 1 logged to Op1 presses, for example, a special PoC button on his terminal. It is assumed that all or parts of the members of the ~~poe~~ Poc-group@op2. net are known/not known in the Op1 PoC application server due to ~~synchro~~synchronisation synchronization/request mechanism.

30

The messages are terminated ~~towards~~ toward all users logged on to Op1 (except user m) and to the users of the group logged on to Op2.

5 The PoC application server 4 in connection with the billing facility 5 may generate billing records and ~~Interconnection~~ interconnection (IC) records for accounting. The PoC AS 4 of Op1 acts as proxy for a single user m of ~~poe~~ Poc-group@op2.net logged on to the ~~operator~~ Operator 1 network and contact the PoC application server 14 for the group ~~poe~~ Poc-group@op2. net located at ~~operator~~ Operator 2. The PoC application server 14 of Operator 2 may be identified by a address derived from the group address, ~~i. e. that is,~~ "... op2. net"

10

Fig. 4 shows the ~~Push-to-Talk User Signalling / Traffic Flow~~ Push-to-Talk user signalling/traffic flow according to a second alternative. Only OP2 is allowed to offer his group ~~poe~~ Poc-group@op2. net to Op1. ~~A user~~ User m with his terminal 1 logged to Op1 presses, for example, a special PoC button on his terminal, and all or parts of the members of the ~~poe~~ Poc-group@op2. net are known/not known in the Op1 PoC application server 4 due to ~~synchronisation~~ synchronization/request mechanism.

15

The messages are terminated ~~towards~~ toward all users logged on to Op1 (except user m) and to the users of the group logged on to Op2.

20

The PoC application server 4 in connection with the billing facility 5 may generate billing records and ~~Interconnection~~ interconnection (IC) records for accounting. The PoC AS 4 of Op1 acts as proxy for a single user of ~~poe~~ Poc-group@op2. net logged on to the ~~operator~~ Operator 1 network and contact the PoC application server 14 for the group located at ~~operator~~ Operator 2.

25

The PoC AS may also act as partial PoC group server (partial group proxy) for all users of ~~poe~~ Poc-group@op2. net logged on to the ~~operator~~ Operator 1 network and contact the PoC server 14 for the group ~~poe~~ Poc-group@op2. net. The traffic between the servers 4 and 14 may be a server-server connection combining the traffic of the partial groups.

30

The server of Operator 2 may be identified by an address derived from the group address, i.e. that is, "... op2. net".

5 Fig. 5 shows the Push-to-Talk ~~User Signalling/Traffic Flow~~ user signalling/traffic flow according to a third alternative. OP2 is allowed to offer his group ~~poc~~ Poc- group@op2. net to Op1 and users of Op1 are allowed to use it. ~~A user m~~ User m, with his terminal 1 logged to Op1, presses, for example, a special PoC button on his terminal; and the message is directly routed to the PoC application server 14 of Operator 2.

10 The messages are terminated ~~towards~~ toward all users logged on to Op1 (except user m) and to the users of the group logged on to Op2.

15 ~~The~~ PoC application server 4 in connection with ~~the~~ billing facility 5 may generate billing records and ~~Interconnection~~ interconnection (IC) records for accounting.

~~The~~ PoC application server 14 of Operator 2 may be identified by a address derived from the group address.

20 While the invention has been described in detail with reference to disclosed embodiments, various modifications within the scope of the invention will be apparent to those of ordinary skill in this technological field. It is to be appreciated that features described with respect to one embodiment typically may be applied to other embodiments. Therefore, the invention properly is to be construed only with
25 reference to the claims and reasonable equivalents.
